

LIMEN-LAND

Agro-ecological communities breaks the urban-rural boundary.

TYPE: Academic / Team work (Zizi Liu, Yixuan Liu, Zhiyin Wei, Junyi Liu)
 DATE: 08/2022-10/2022
 LOCATION: Shanghai, China

Through a modular paradigm construction, a self-sufficient agro-ecological community with various functions required for agricultural life will be created in the urban-rural area to improve agricultural productivity, alleviate employment problems and drive the development of neighboring industries.

It will become a bridge between rural and urban people, changing the stereotypes of each other and integrating the habits, perceptions, and ideas of both sides by living together, farming together, and thinking together. Finally, we believe "The Citizens" will create a culture that is unique to the community by its own.

BACKGROUND

Current Situation

The Problems of Urban and Rural Space

AIM

An alternative to traditional agriculture is needed.

We need prototype a new rural-urban union that challenges the standard binary relationship between the two and search for prototypes that "fold" the rural and urban landscapes together, to propose an integrated rural-urban infrastructure to create a productive, hybridized future.

INVESTIGATION OF 6 SITES

How to choose 6 sites all over the world?

Selection is based on the natural conditions and socio-economic base of the city. The cities are classified into different classes of merit and demerit. Six sites covering cities of different sizes and conditions in search of paradigmatisation.

Natural Conditions

Suitable for urban development, with a certain agricultural base.

Socio-economic Base

Current urban and rural development is good, but reveals more real problems.

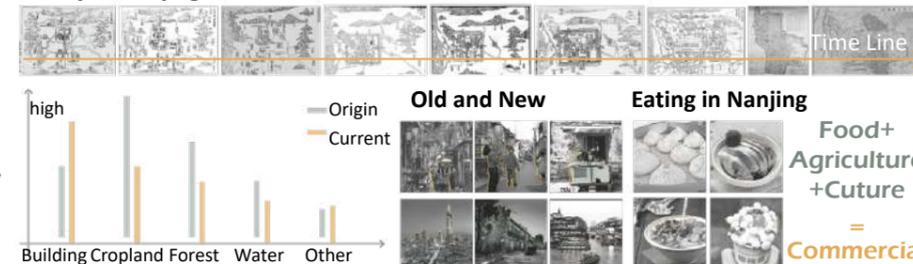

PUKOU, NANJING, CHINA

Scale
First-tier city
Provincial capital city

Population density
20351 people/sq km

History of Nanjing:

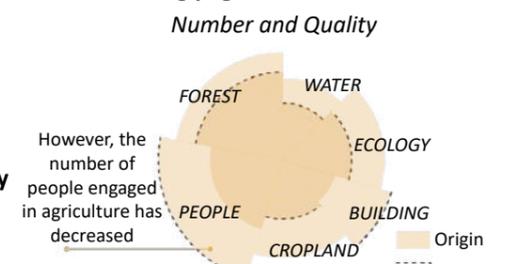

YUBEI, CHONGQING, CHINA

Scale
First-tier city
Municipality

Population density
19069 people/sq km

Trends of Chongqing:

Featured of Chongqing:

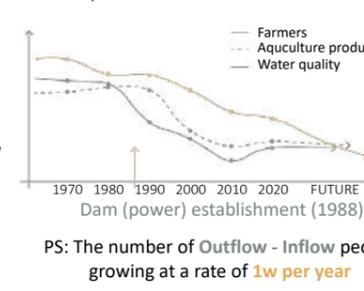

HIDAKAGAWA, WAKAYAMA, JAPAN

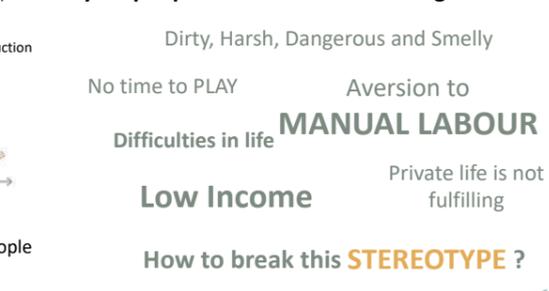

Scale
Coastal city

Population density
9258 people/sq km

Trends (economic + environmental)

Why do people not want to work in agriculture?

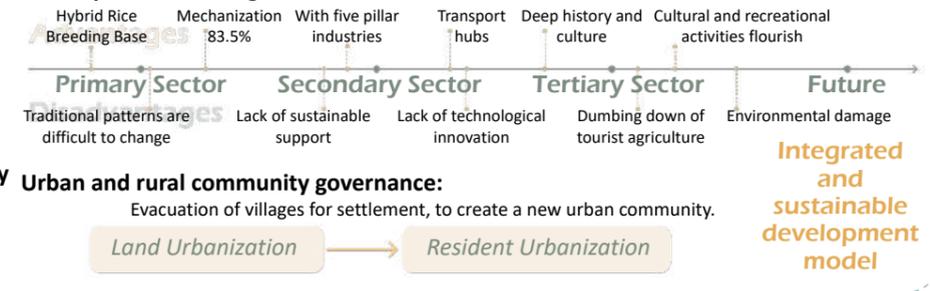

YUELU, CHANGSHA, CHINA

Scale
New First-tier city
Provincial capital city

Population density
15981 people/sq km

Development of Changsha:

SONGJIANG, SHANGHIA, CHINA

Scale
Mega-city
Municipality

Population density
25923 people/sq km

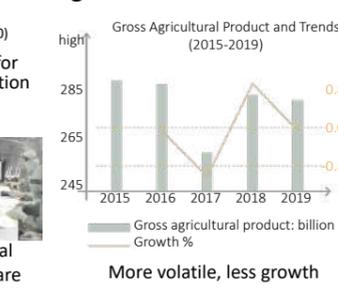

Migrant workers of Shanghai:

58%
Non-domiciled population: 10,479,700(in 2020)
The farming-related areas account for 67.8% of the city's migrant population

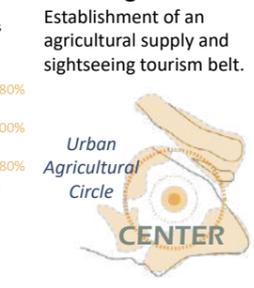

Problems of migrant workers:

Agricultural situation:

Urban Agricultural:

SHIMANTO, KOUCHI, JAPAN

Scale
Coastal city

Population density
19305 people/sq km

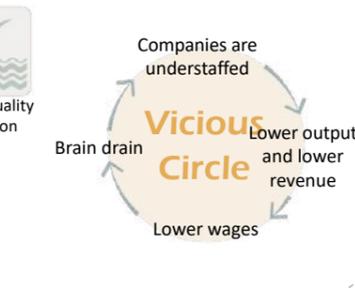

Ecological issues:

Economic issues:

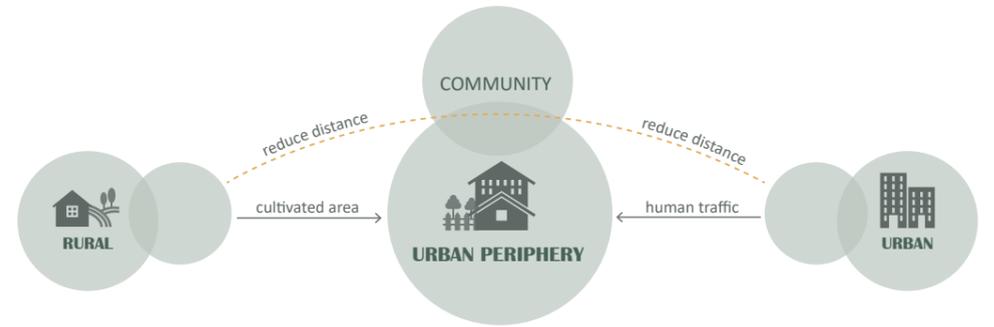

Tourist farming is developing from urban centres to the suburbs, but in diminishing numbers.

Vicious circle:

HOW TO RELIEVE OR RESOLVE?

So,
 How should we go about alleviating rural hollowing out?
 How should we make fresh food available to all?
 How do we mitigate the urban encroachment on the countryside?
 How can we build our own food system that connects urban and rural areas while protecting the natural environment?

Remove Resources → **Remove People**

We believe that creating an **Agricultural Community** at the boundary between urban and rural areas that can be applied to a wide range of environments can go a long way in alleviating these problems.

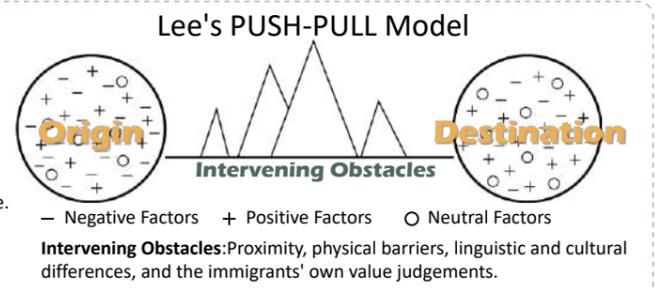

Theoretical support

Purpose: to improve living conditions.

Pull factors: factors favouring improved living conditions
 Ex. democratic gov., thriving economies, job opportunities.

Push factors: unfavourable living conditions
 Ex. poverty, political instability, religious intolerance.

Both pull and push factors are present in both the origin and the destination.

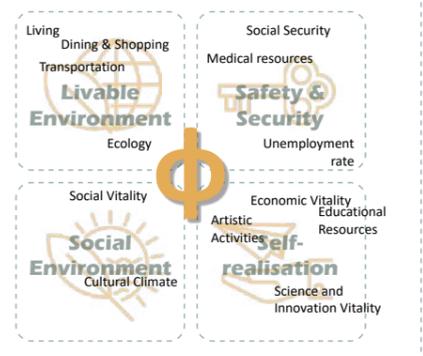

City Attraction Model

The long-term sustainability of a city is due to the role of ϕ (City attraction). If the city is imagined as a mass of water, and the coalescence and escape of water molecules is understood as the flow of people in and out, a mathematical model of urban population movement can be developed.

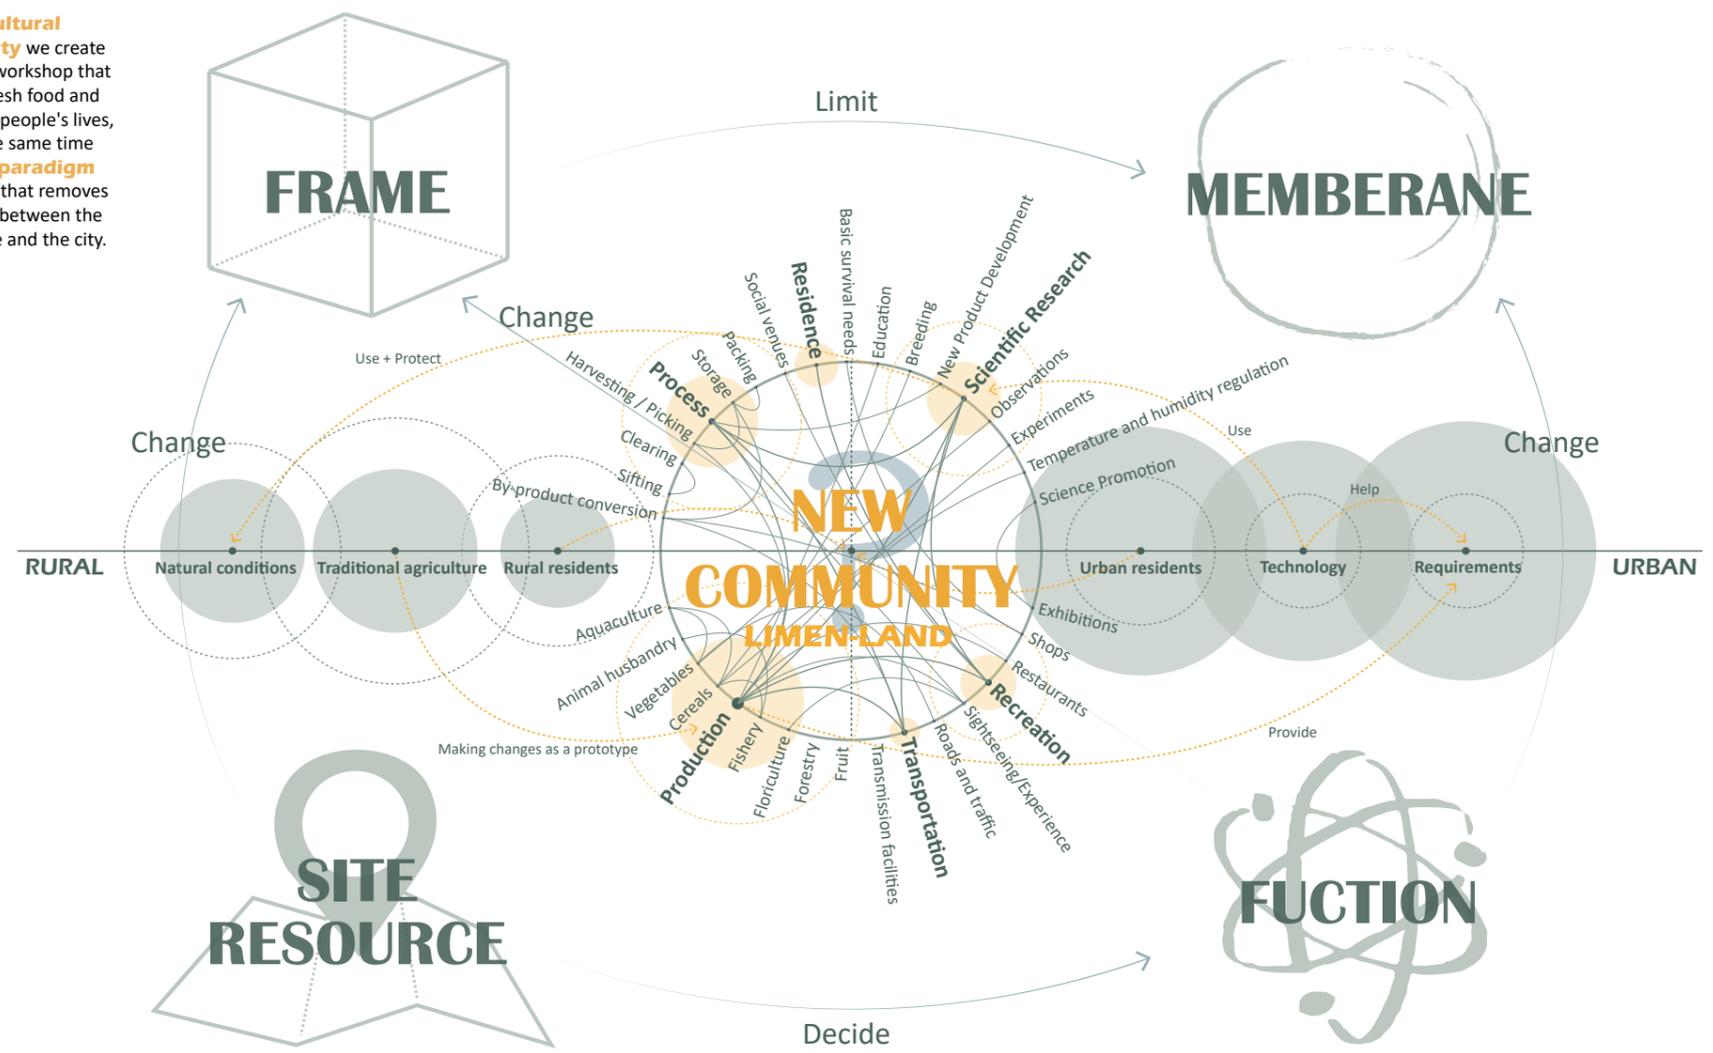

$$\Delta N = \sigma E \{ m(t) [1 - \lambda e^{-\phi}] - n(t) e^{-\phi} \}$$

- ΔN the amount of change in the city's population.
- E policies, regulations, ordinances, etc. of the city.
- σ Enforcement of policies, regulations, ordinances, etc.
- $m(t)$ Net increase in incoming population = all incoming - all in transit.
- $n(t)$ net increase in outflow = total outflow - return.
- ϕ the potential of the city, i.e. the attractiveness of the city.
- λ return rate

DESIGN CONCEPT

The **agricultural community** we create exists as a workshop that provides fresh food and transforms people's lives, while at the same time acting as a **paradigm of eraser** that removes the border between the countryside and the city.

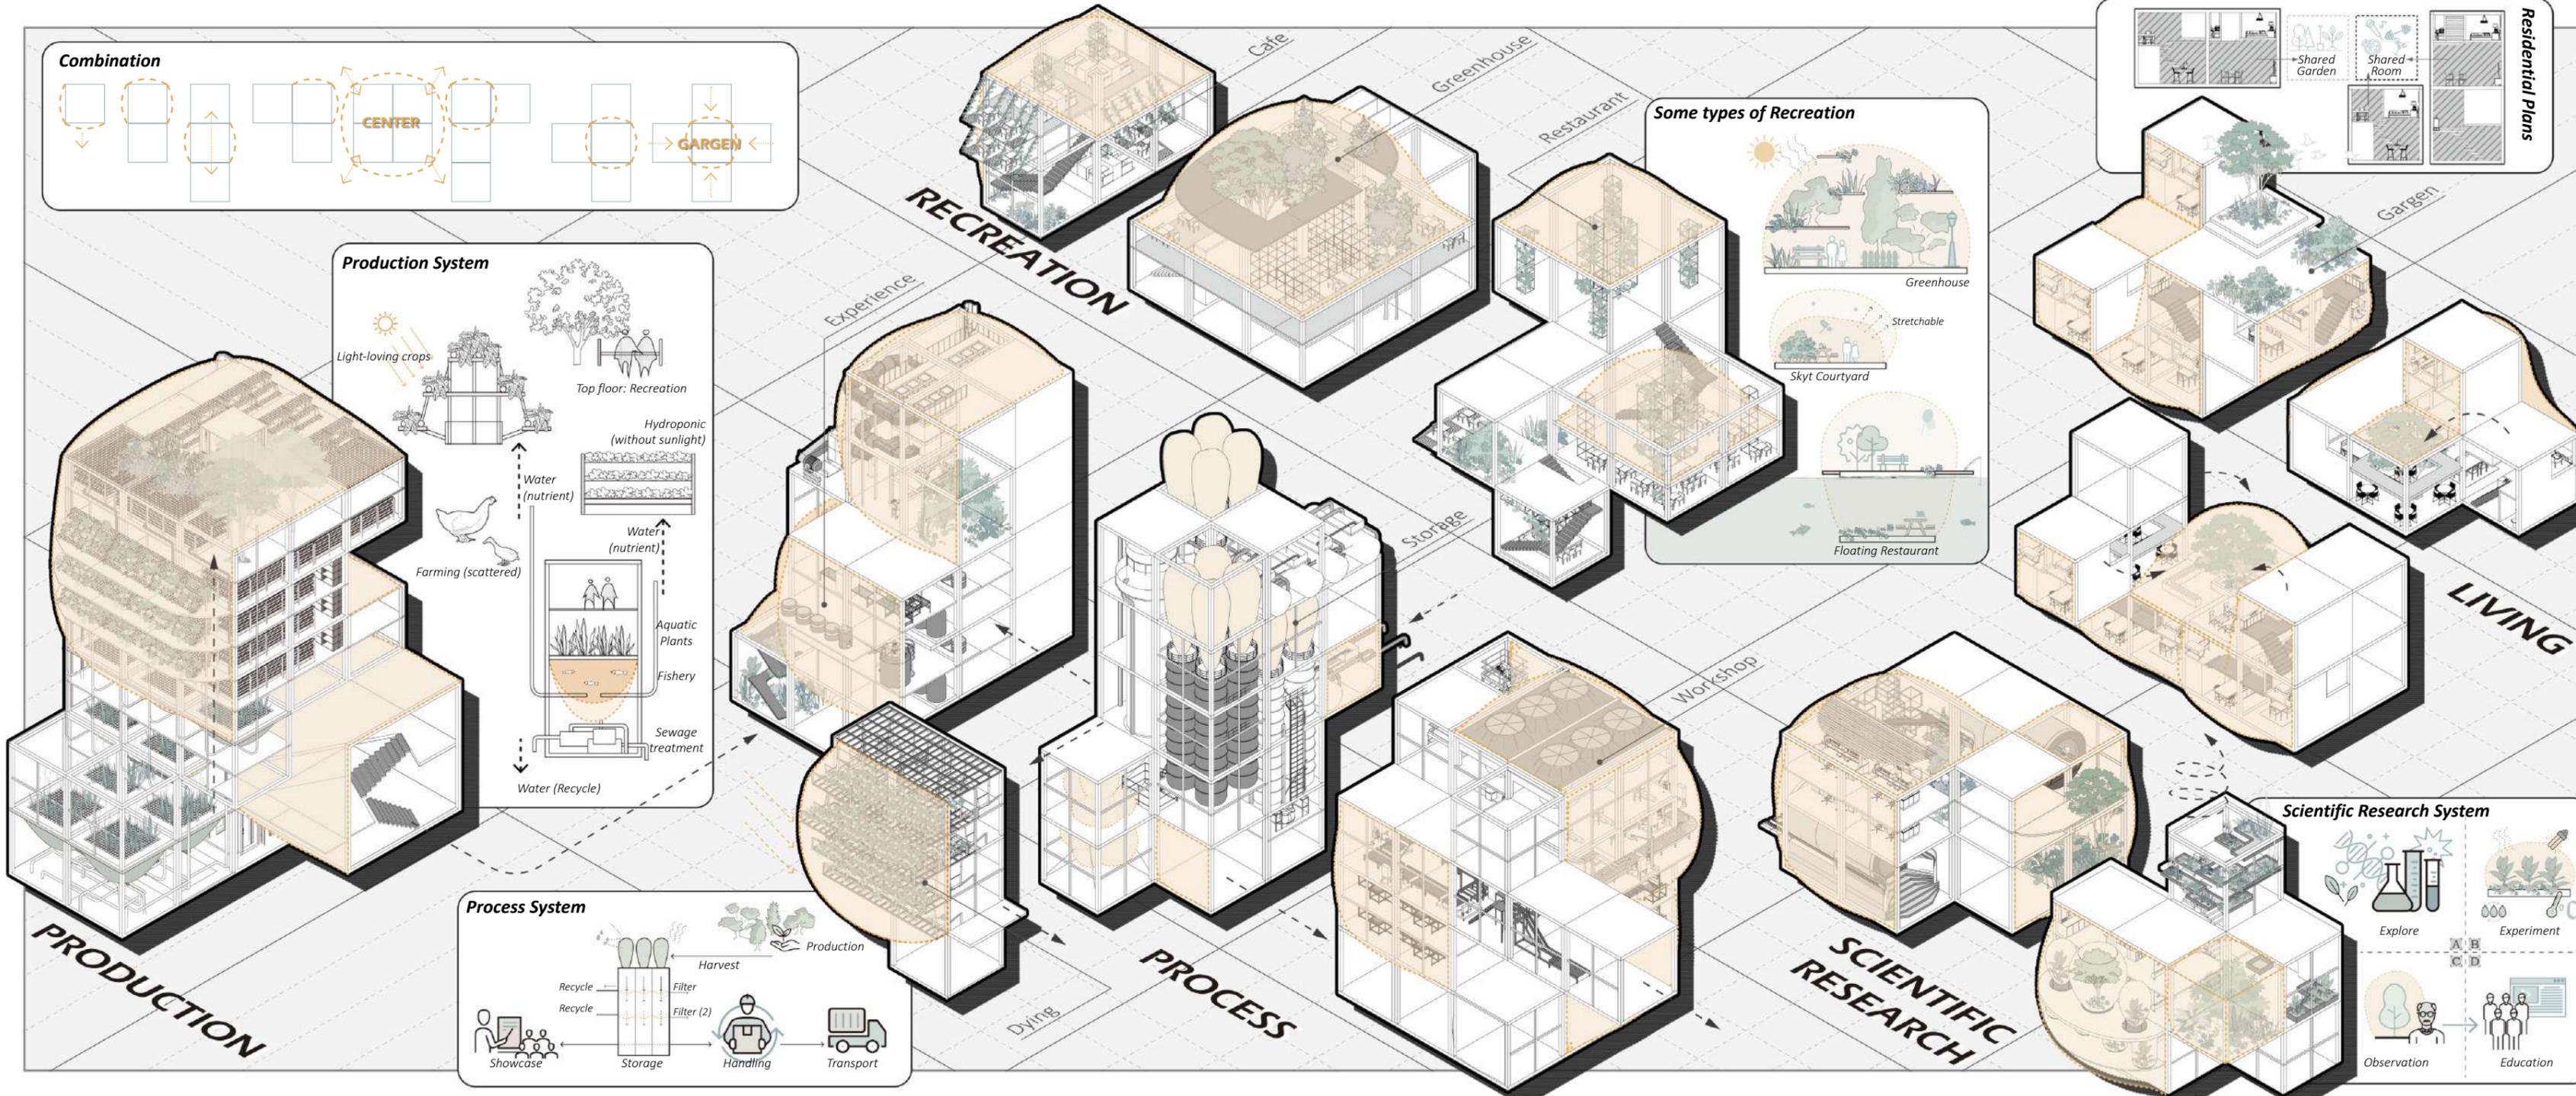

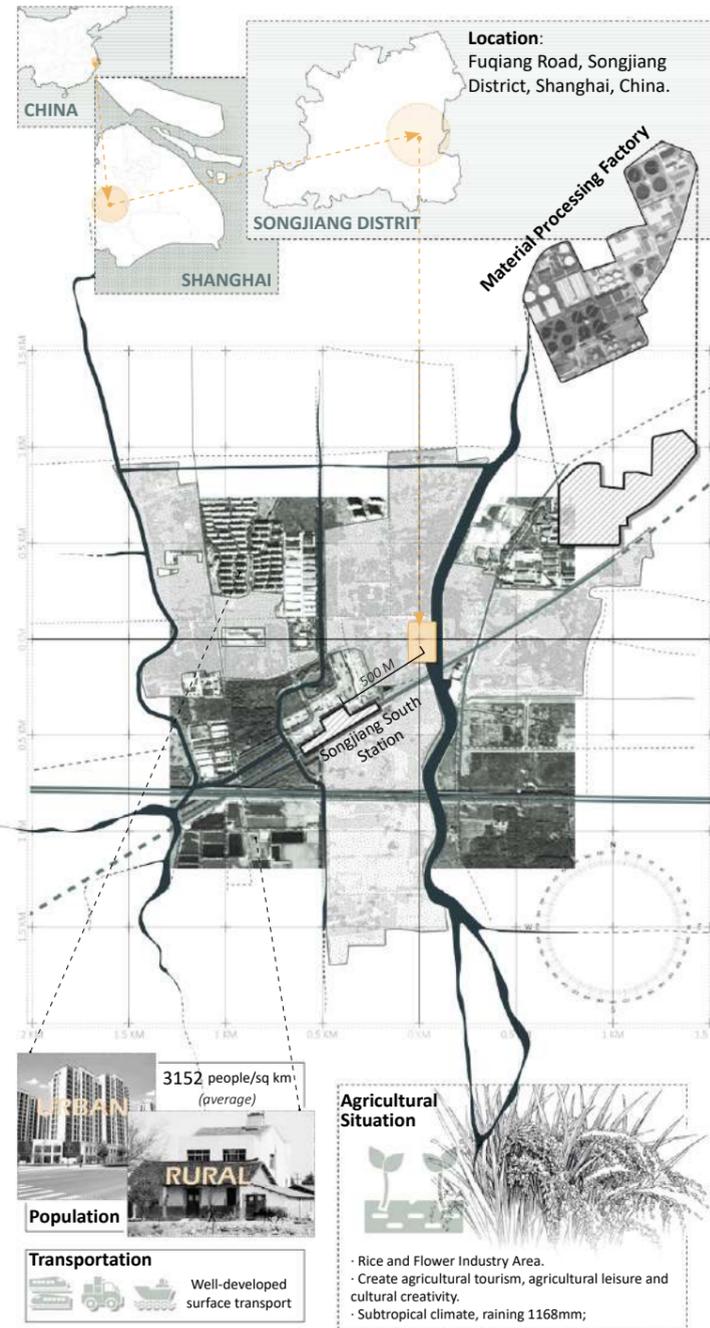

Current agricultural production methods

Production	Process	Scientific Research	Living & Recreation
Greenhouse Gardening	Ensure Ventilation, Control light (change color), Filtering water, separate soil	Pilot field	Floating Restaurant
Fishery	Shrink + Enlarge (Marum), Purifying effect	Breeding Base	Shops
Symbiotic system	Screening, filtration, recycling	Biogene Bank	Greenhouse Garden
Medium Production	Ventilation, dehumidification, Product Storage	Education	Public Sanitary Room
Large Production	Flexible Space	Single Observation	Residential areas

SITE ANALYSIS OF SONGJIANG, SHANGHAI

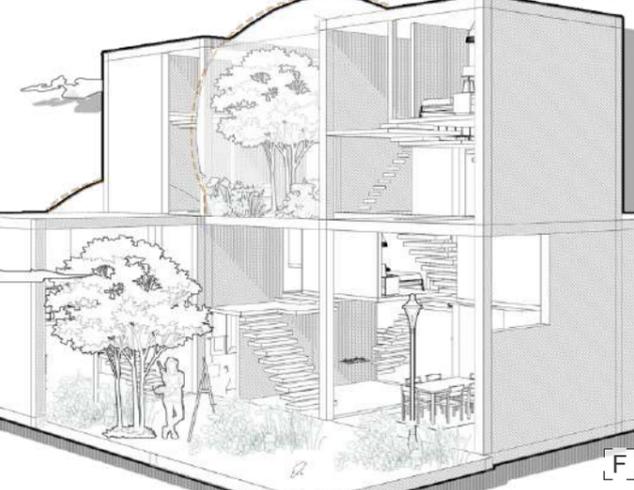

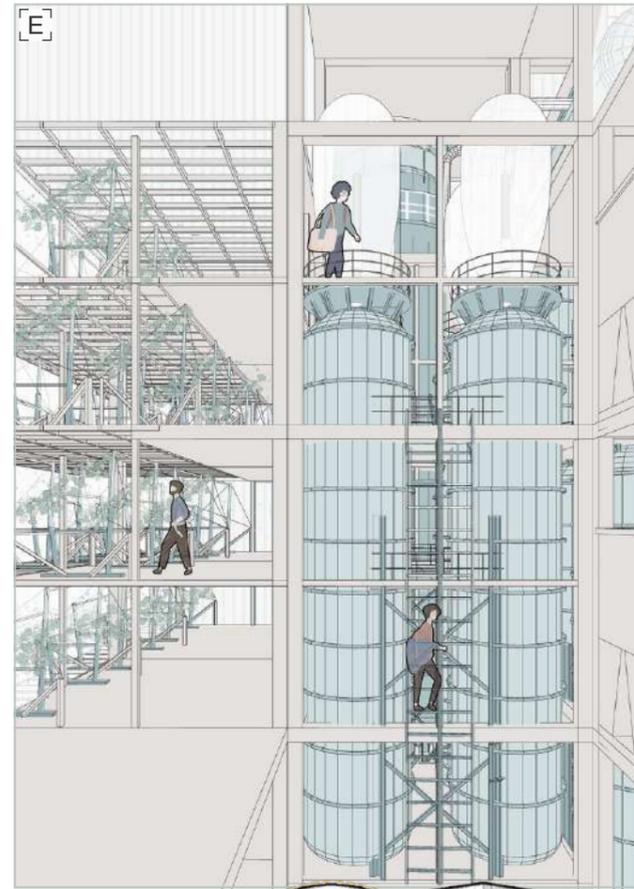

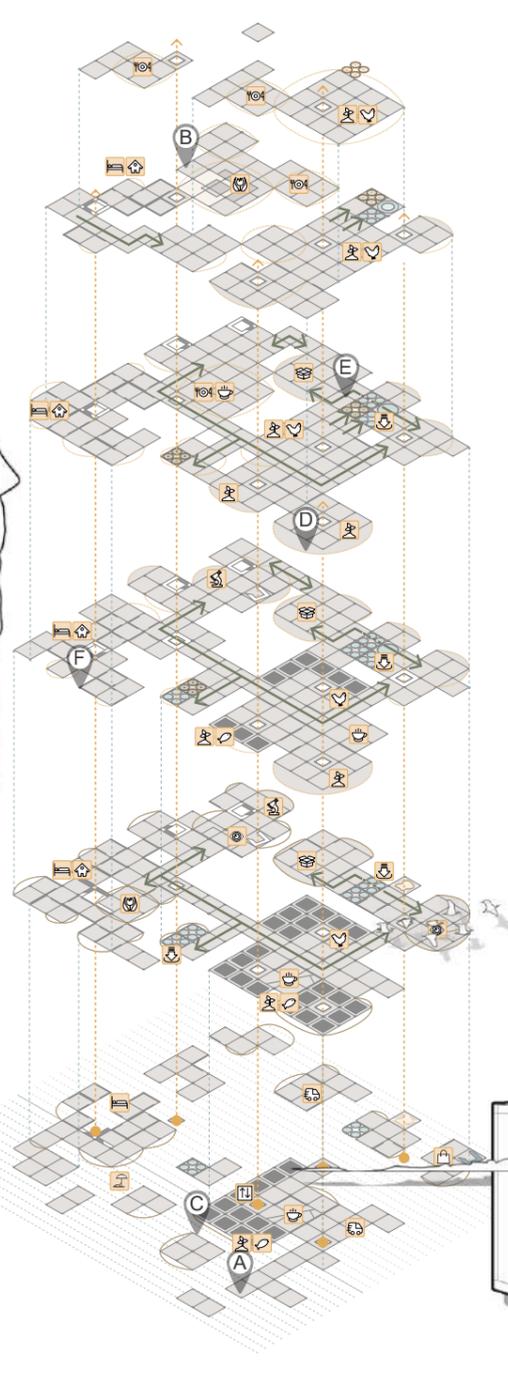

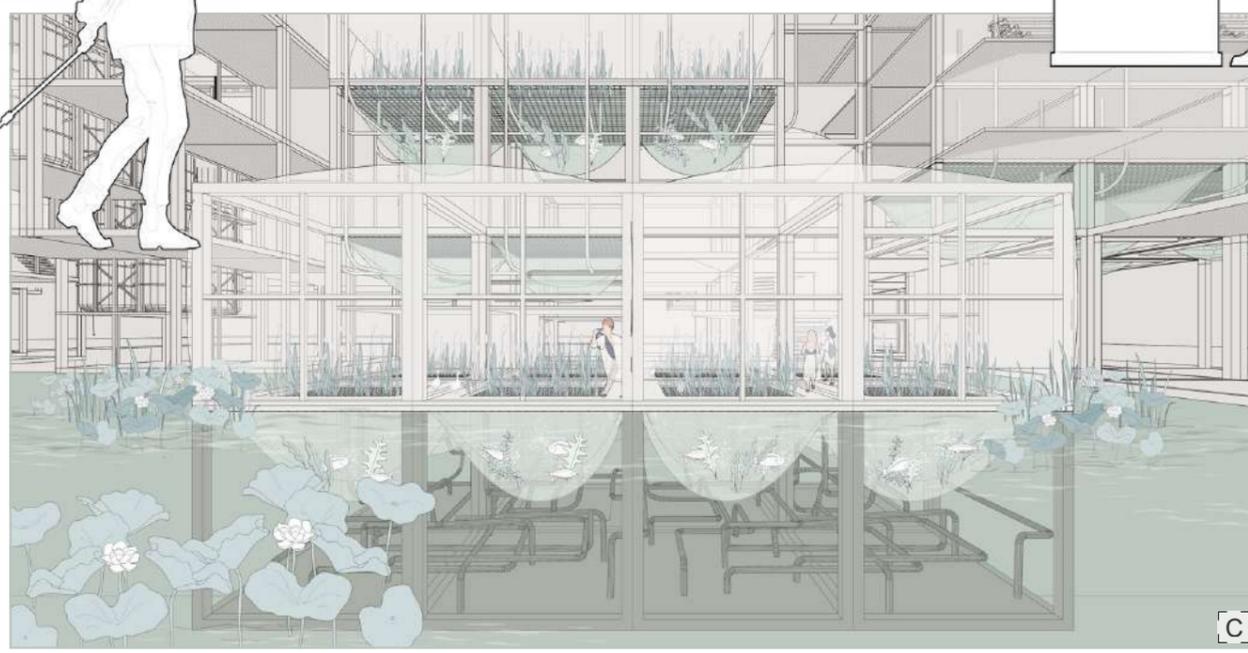

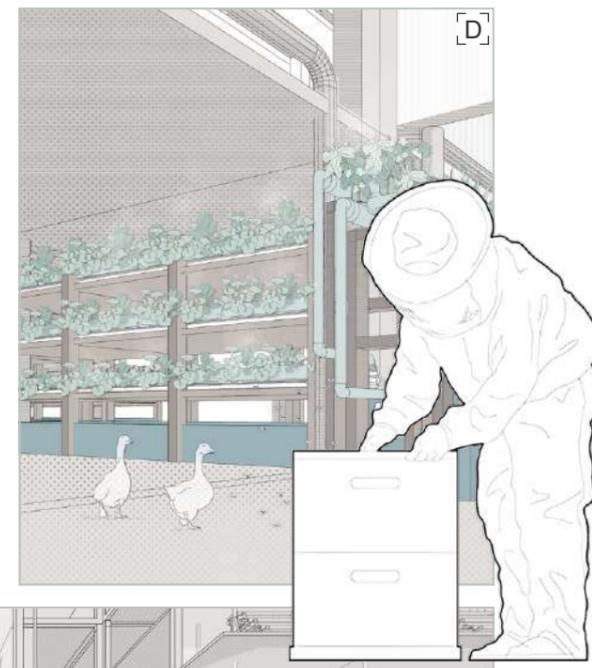

C: Wow, this place is so beautiful and vibrant too. I'm falling in love with it.

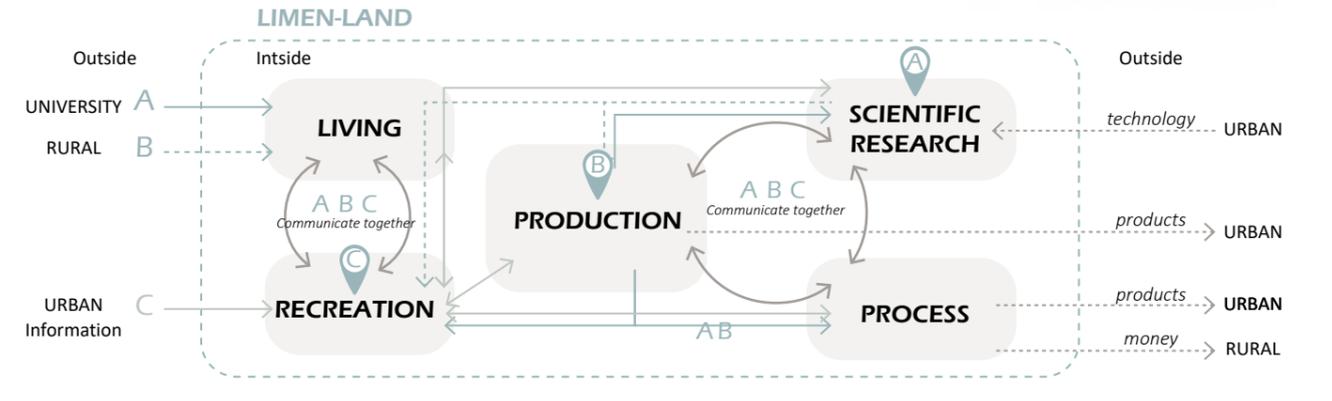

A: This is our greenhouse garden on the top floor, which cultivates plants and animals from all over the country. You can roam around here and have a cup of coffee if you wish.

B: This is the area where I work. The vegetables in the lower part of this area are usually eaten by the free-range chickens and ducks. The food you eat in the community is all original.
